Build one guard that stops a bad actor.

Find weaknesses in the SAAF agents, then turn what you learn into a skill, a workflow or a CI check that any SAAF repository can reuse. Give it a name. Prizes for the best three.

Skill

For example an injection guard that marks auditee documents as data, not instructions.

Workflow

For example a secret scan over the full git history on every push.

CI check

For example a dependency audit that fails the build on a critical advisory.

Hand in your findings

Mail a CSV to info@saafproject.com

Subject	`SAAF findings: your team name`
How often	As often as you like. Every mail adds to your team's count; repeats are removed.
Format	One plain `.csv` attachment per mail. No zip, Excel, PDF or links: those are ignored.
Deadline	Last CSV before **16:30**.

`max 500 rows per CSV` `max 1 MB` `UTF-8`

`comma or semicolon`

Columns, in this order

```
title,repo,risk_rating,observation,
recommendation,verified,team
"Short title",Vendor_Guard,High,"...",
"...",yes,Team
```

`repo` is the SAAF-Project repository name or the site. `risk_rating` is Critical, High, Medium, Low or Informational. `verified` is yes or no.

What counts as one finding

Counts	One weakness in one place: a repo plus file, endpoint or site; behaviour that is not what was intended or safe; a plausible security, privacy or audit impact.
In scope	SAAF-Project repos and their PRs that were live before 13:30 today, plus the live SAAF sites. Repos or PRs created today do not count.
Once	The same root cause in one repo counts once.
Per repo	The same issue in three repos counts three times.
Not new	Anything among the 127 found before today, false positives, third-party services, repos outside SAAF-Project.
Never	No live keys or secret values, no personal data, no attacks on live systems. Local copies only; live sites passive only.

Tip for your agent: *"Export our findings as CSV with exactly these columns, one row per distinct weakness, no secret values."*

The afternoon

14:05	What the hackers found, five minutes each.
14:45	Assignment and quiz, then form teams: at least one hacker or developer each.
by 16:15	Sign up for a demo in the portal.
16:30	Demos, **offline on your own laptop.** Random order, five minutes at most.
17:00	The jury deliberates. Grab a drink.
17:10	Prizes, and the quiz winner.
17:30	Pizza, if you said yes in the portal by 16:00.

Judged on: does it stop a real finding from today, can another SAAF repo reuse it, is it named and documented (README, how to run, limitations).

The quiz

Guess the total at 17:00.
127 findings before today, plus every new one the teams hand in. Sign in with GitHub, one guess each, change it until 17:00. Closest guess wins.

`saaf-portal.vercel.app/quiz`
